Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

Please amend claims 1, 12, and 18 as follows:

1. (Currently Amended) A method of recovering depth information for pixels of a base image representing a view of a scene, the method comprising the steps of:

detecting a plurality of pixels in a base image that represents a first view of a scene, wherein the first view is one of at least three relative views of a scene;

determining 3-D depth of the plurality of pixels in the base image by matching correspondence to a plurality of pixels in three or more relative images, ~~each image~~ representing ~~one of~~ the at least three relative views of the scene, wherein the three or more images are captured relative to each other and are of the same scene, simultaneously, and wherein ~~each of~~ the at least three relative views of the scene are situated in a non-linear arrangement relative to each other and are further oriented in a ~~plurality of~~ non-parallel planes relative to each other; and

tracing pixels in a virtual piecewise continuous depth surface by spatial propagation starting from the detected pixels in the base image by using the matching and corresponding plurality of pixels in the three or more relative images to create the virtual piecewise continuous depth surface viewed from the base image, each successfully traced pixel being associated with a depth in the scene viewed from the base image.

Appl. No. 09/927,558
Amdt. dated 7/19/2006
Reply to the Office Action of April 19, 2006

2. (Previously Presented) The method of Claim 1, wherein the step of determining the 3-D depth comprises the steps of:

detecting a plurality of image pixels in a first image corresponding to a first view of a scene;

detecting a plurality of image pixels in at least a second image corresponding to a respective at least a second view of the scene, wherein the at least a second image deviates from the first image as a result of camera relative motion;

determining a first two-view correspondence between the plurality of detected image pixels in the first image and a plurality of detected image pixels in one of the at least a second image resulting in a potential two-view match set of candidate image pixels between the first image and the one of the at least a second image;

concatenating a plurality of two-view match sets to form a first multiple-view potential match set; and

determining a second multiple-view potential match set that is a refinement of the first multiple-view potential match set.

3. (Previously Presented) The method of claim 2, wherein the second multiple-view potential match set is based at least in part on a least median of squares computation of the reprojection errors related to matched pixels in the first multiple-view potential match set.

4. (Original) The method of Claim 1, wherein the tracing step comprises the step of:

propagating a front of a virtual piece of a continuous depth surface to at least one neighboring pixel starting from the detected pixels in the base image.

5. (Original) The method of Claim 4, wherein the tracing step comprises the step of:

determining when a boundary is reached between two propagating fronts of virtual pieces of a continuous depth surface.

Appl. No. 09/927,558
Amdt. dated 7/19/2006
Reply to the Office Action of April 19, 2006

6. (Original) The method of Claim 4, wherein the tracing step comprises the steps of:
comparing the matching costs of the two propagating fronts about the reached boundary;
and
stopping the propagation of the front with the higher compared matching cost.
7. (Original) The method of Claim 1, wherein the tracing step comprises the step of:
propagating a front of a virtual piece of a continuous depth surface to at least one
neighboring pixel surrounded by a predefined size window in the continuous depth surface.
8. (Original) The method of Claim 7, wherein the tracing step comprises the step of:
determining when a boundary is reached between two propagating fronts of virtual pieces
of a continuous depth surface.
9. (Original) The method of Claim 7, wherein the tracing step comprises the steps of:
comparing the matching costs of the two propagating fronts about the reached boundary;
and
stopping the propagation of the front with the higher compared matching cost.
10. (Previously Presented) The method of Claim 9, wherein the matching cost is determined by
computing the summation of all the normalized cross-correlations between a first image window
of a pre-determined size in the base view, and a second image window of the same pre-
determined size in one of at least one reference view.
11. (Previously Presented) The method of Claim 10, further comprising a step of:
rectification of at least one pair of images corresponding to the base view of the scene
and one of the at least one reference views.

12. (Currently Amended) An image processing system comprising:

a memory;

a controller/processor electrically coupled to the memory;

an image matching module, electrically coupled to the controller/processor and to the memory, for providing a plurality of seed pixels that represent 3-D depth of the plurality of pixels in the base image view of a scene by matching correspondence to a plurality of pixels in three or more relative images representing a plurality of relative views of the scene, wherein the three or more relative images are captured relative to each other and are of the same scene, simultaneously, and wherein the base image view is one of at least three relative views of the scene, ~~each of the~~ at least three relative views of the scene being situated in a non-linear arrangement and are further oriented in ~~a plurality of~~ non-parallel planes relative to each other; and

a propagation module, electrically coupled to the controller/processor and to the memory, for tracing pixels in a virtual piecewise continuous depth surface by spatial propagation starting from the provided plurality of seed pixels in the base image by using the matching and corresponding plurality of pixels in the three or more relative images to create the virtual piecewise continuous depth surface viewed from the base image, each successfully traced pixel being associated with a depth in the scene viewed from the base image.

13. (Original) The image processing system of claim 12, further comprising at least one camera interface, electrically coupled to the controller/processor, for sending image information from at least one camera to the controller/processor.

14. (Original) The image processing system of claim 12, wherein the controller/processor, the memory, the image matching module, and the propagation module, are implemented in at least one of an integrated circuit, a circuit supporting substrate, and a scanner.

15. (Original) The image processing system of Claim 12, wherein the propagation module is further for determining when a boundary is reached between two propagating fronts of virtual pieces of a continuous depth surface.

16. (Original) The image processing system of Claim 15, wherein the propagation module is further for comparing the matching costs of the two propagating fronts about the reached boundary; and

stopping the propagation of the front with the higher compared matching cost.

17. (Original) The image processing system of Claim 12, wherein the propagation module is further for propagating a front of a virtual piece of a continuous depth surface to at least one neighboring pixel surrounded by a predefined size window in the continuous depth surface.

18. (Currently Amended) A computer readable medium including computer instructions for a 3-D image reconstruction computer system, the computer instructions comprising instructions for:

detecting a plurality of pixels in a base image that represents a first view of a scene, wherein the first view is one of at least three relative views of a scene;

determining 3-D depth of the plurality of pixels in the base image by matching correspondence to a plurality of pixels in three or more relative images, ~~each image~~ representing ~~one of~~ the at least three relative views of the scene, wherein the three or more images are captured relative to each other and are of the same scene, simultaneously; and wherein ~~each of~~ the at least three relative views of the scene are situated in a non-linear arrangement relative to each other and are further oriented in a ~~plurality of~~ non-parallel planes relative to each other; and

tracing pixels in a virtual piecewise continuous depth surface by spatial propagation starting from the detected pixels in the base image by using the matching and corresponding plurality of pixels in the three or more relative images to create the virtual piecewise continuous depth surface viewed from the base image, each successfully traced pixel being associated with a depth in the scene viewed from the base image.

19. (Previously Presented) The computer readable medium of claim 18, wherein the step of determining the 3-D depth comprises the steps of:

detecting a plurality of image pixels in a first image corresponding to a first view of a scene;

detecting a plurality of image pixels in at least a second image corresponding to a respective at least a second view of the scene, wherein the at least a second image deviates from the first image as a result of camera relative motion;

determining a first two-view correspondence between the plurality of detected image pixels in the first image and a plurality of detected image pixels in one of the at least a second image resulting in a potential two-view match set of candidate image pixels between the first image and the one of the at least a second image;

concatenating a plurality of two-view match sets to form a first multiple-view potential match set; and

determining a second multiple-view potential match set that is a refinement of the first multiple-view potential match set.

20. (Previously Presented) The computer readable medium of claim 19, wherein the second multiple-view potential match set is based at least in part on a least median of squares computation of the reprojection errors related to matched pixels in the first multiple-view potential match set.

21. (Original) The computer readable medium of claim 18, wherein the tracing step comprises the step of:

propagating a front of a virtual piece of a continuous depth surface to at least one neighboring pixel starting from the detected pixels in the base image.

22. (Original) The computer readable medium of Claim 21, wherein the tracing step comprises the step of:

determining when a boundary is reached between two propagating fronts of virtual pieces of a continuous depth surface.

Appl. No. 09/927,558
Amdt. dated 7/19/2006

23. (Original) The computer readable medium of Claim 21, wherein the tracing step comprises the steps of:

comparing the matching costs of the two propagating fronts about the reached boundary;
and

stopping the propagation of the front with the higher compared matching cost.

24. (Original) The computer readable medium of Claim 18, wherein the tracing step comprises the step of:

propagating a front of a virtual piece of a continuous depth surface to at least one neighboring pixel surrounded by a predefined size window in the continuous depth surface.

25. (Original) The computer readable medium of Claim 24, wherein the tracing step comprises the step of:

determining when a boundary is reached between two propagating fronts of virtual pieces of a continuous depth surface.

26. (Original) The computer readable medium of Claim 24, wherein the tracing step comprises the steps of:

comparing the matching costs of the two propagating fronts about the reached boundary;
and

stopping the propagation of the front with the higher compared matching cost.

27. (Original) The computer readable medium of Claim 26, wherein the matching cost is determined by computing a normalized cross-correlation between the windows associated with the two propagating fronts about the reached boundary.

28. (Original) The computer readable medium of Claim 27, further comprising a step of:

rectification of at least one pair of images corresponding to at least one pair of views of the scene.

Appl. No. 09/927,558
 Amdt. dated 7/19/2006
 Reply to the Office Action of April 19, 2006

29. (Currently Amended) A method of recovering depth information for pixels of a base image representing a view of a scene, the method comprising the steps of:

capturing a base image representing a view of a scene;

tracing at least one parameter surface associated with the base image, each of the at least one parameter surface traced starting from at least one predetermined seed pixel point associated with the base image; and

calculating a derivative of function $E(g)$ with respect to parameter g by using finite difference to minimize the following equation

$$E(g) = \sum_{i=1}^m \left\{ 1 - \text{NCC} \left[I_i(\bar{u}(g), \bar{v}(g)), I_0(u_j, v_j) \right] \right\},$$

where $\text{NCC} \left[I_i(\bar{u}, \bar{v}), I_0(u_j, v_j) \right]$ is a normalized cross-correlation between $I_i(\bar{u}, \bar{v})$ and $I_0(u_j, v_j)$;

$I_i(\bar{u}, \bar{v})$ is a first window of size $\omega \times \omega$ centered at pixel (\bar{u}, \bar{v}) in I_i ,

$I_0(u_j, v_j)$ is a second window of size $\omega \times \omega$ centered at pixel (u_j, v_j) in I_0 ,

I_i is a reference image,

I_0 is a base image.

(\bar{u}, \bar{v}) is a pixel point closest to $P(C_0 + gL(u_j, v_j))$;

$C_0 + gL(u_j, v_j)$ is a 3-D point that projects to (u_j, v_j) in the base view, and to $P(C_0 + gL(u_j, v_j))$ in the i^{th} reference view;

C_0 is the base image camera's center of projection;

$L(u_j, v_j)$ is the unit vector from C_0 to the point on the image plane that corresponds the pixel (u_j, v_j) ; and

g is a depth parameter[.]; and

storing the calculated derivative of the function $E(g)$ in a memory.
